1) Analysing the effect of leasing land on land fragmentation and economic performance. Changing the size of the farm when extra land is leased changes the land fragmentation but it simultaneously changes the size of the farm. A cross sectional dataset from 2014 can be used to assess the opposite economic effects when leasing land.

2) Analysing the effects of economic performance of irregular field shape. Field shape has not been found to have a significant effect on farm performance, but this is hypothesized to be caused by selection bias. Is field shape of any relevance to farm performance?
