### **Constructing new assortment distributions for the forestry sector**

Assortment distributions being used in Denmark are based on collaboration between different actors in the sector. However data are rather old, and assortments have changed a lot during the last decade. How much does that matter for the recommendations that are being provided by various actors in the sector? Developing new assortment distributions is needed. This requires data collection and contact with the different actors, statistical analysis of data, and potentially also a recalculation of selected recommendations to see how much it changes the results. The results of the project will gain a lot of interest from the forestry sector in Denmark.
