We have recently conducted a primary valuation survey together with DTU Aqua, interviewing more than 600 anglers on-site on the coastline of Fyn, and more than 300 of these have subsequently answered an online questionnaire. The data includes a full-scale Choice Experiment aimed at investigating anglers' preferences for angling trip attributes (catch, regulations, social aspects). Besides that, there is travel cost data, and detailed consumption data. We are now offering one or two MSc thesis students the opportunity to be the first to analyze this data which would fit perfectly for a Master thesis. It's a chance to work on real-life data in an interdisciplinary research context. Results are likely to be incorporated into a scientific report from DTU Aqua as well as feeding into the local angling management policies on Fyn.
